

M-Link Bridge Service

Live video and audio to your corporate video conferencing unit over the internet via Livewire’s hosted server.

Overview

M-Link Bridge offers a solution for customers wishing to link a feed from an M-Link Live X client via our M-Link Live receiver (server) to a corporate video conferencing unit.

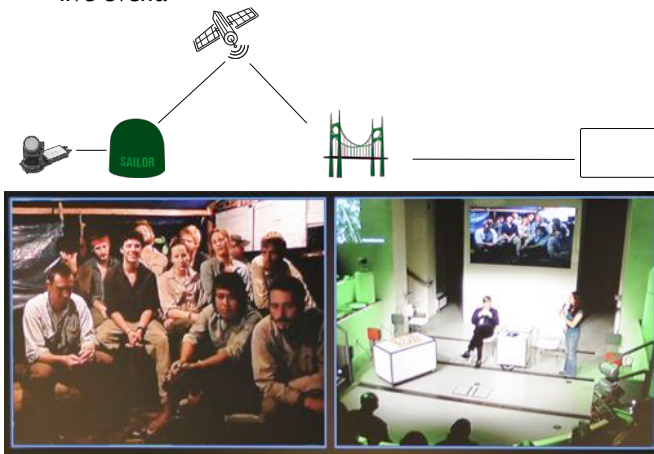

The solution is offered as a service for those customers who do not have their own receive server infrastructure, or it can be used by the customer with their own server infrastructure as a method of forwarding the video to a corporate video conferencing facility.

Key Features

- Equipped with a video camera, laptop and internet connection anybody can contribute live video to a standards compliant video conferencing system
- Livewire Digital will support the end to end process with real-time monitoring and co-ordination of both ends

Specifications

- Livewire’s M-Link Live-X software will run on a laptop or desktop computer with a Firewire port, running on Windows (XP Pro, Vista, Windows 7) or OSX (Leopard onwards).
- The live video and audio stream is transmitted over your available Internet connection to our M-Link Live receiver in the UK. A minimum upload speed of 300 kilobits per second is recommended. This is easily achieved using Inmarsat’s BGAN X-Stream service.
- The video conferencing “bridge” uses standard H.323 and SIP protocols to interface with Polycom, Tandberg, Cisco and other compliant video conferencing systems.
- Customer video conferencing system must be accessible to the public internet, this will be tested prior to any live event.

M-Link Bridge Topology

M-Link Bridge live link between Heart of Borneo researchers in the Indonesian jungle and an audience at the Natural History Museum in London. The Borneo team were connected using an Inmarsat BGAN satellite terminal via Livewire Digital’s M-Link Bridge over the internet to the museum’s Polycom VC system for two twenty minute two-way video conferences.
